

Project Apollo: Next-Generation Renewable Energy Architecture

1. Executive Summary

Project Apollo is an initiative designed to transition corporate data centers to 100% solar and wind power.

The total capital expenditure allocated for this initiative is \$45 million over five fiscal years.

2. Technical Specifications and Battery Storage

Apollo uses high-density lithium-iron-phosphate (LFP) battery banks providing 250 MWh of storage capacity.

Thermal management is governed by closed-loop dielectric liquid cooling.

Key risk factor: Battery cell supply chain constraints in Q3.
